GSM FILE AT Commands

GSM_FILE _ATC_V1.1

Document Title	GSM FILE AT Commands
Version	1.1
Date	2010-6-24
Status	Release
Document Control ID	GSM_FILE _ATC_V1.1

General Notes

Quectel offers this information as a service to its customers, to support application and engineering efforts that use the products designed by Quectel. The information provided is based upon requirements specifically provided for Quectel by the customers. Quectel has not undertaken any independent search for additional relevant information, including any information that may be in the customer's possession. Furthermore, system validation of this product designed by Quectel within a larger electronic system remains the responsibility of the customer or the customer's system integrator. All specifications supplied herein are subject to change.

Revision	Date	Author	Description of change
1.0	2010-04-15	Jay XIN	Initial
1.1	2010-06-10	Jay XIN, Joanna LI	Support SD and RAM

1. Introduction

Quectel Module provides AT commands to operate files in RAM, flash and SD card. This document is a reference guild to these commands.

1.1. Reference

Table 1: Reference

SN	Document name	Remark
[1]	Mxx_ATC	The introduction of AT commands for Mxx

1.2. Terms and abbreviations

Table 2: Terms and abbreviations

Abbreviation	Description
UFS file	File saved in User File Storage directory in Module flash
RAM file	File saved in RAM, only M33 supports
SD file	File saved in Picture directory of SD card, only M33 supports

2. AT Commands for FILE

Quectel Module provides AT commands to operate files in RAM, flash and SD card. Only M33 supports the file operations on RAM and SD card. And The SD card only supports three file systems: FAT, FAT16 and FAT32.

2.1. Overview of AT commands for File

Command	Description
<u>AT+QFLDS</u>	Get storage data size
<u>AT+QFLST</u>	List files
<u>AT+QFUPL</u>	Upload file to storage
<u>AT+QFDWL</u>	Download file from storage
<u>AT+QFDEL</u>	Delete file in storage
<u>AT+QFMOV</u>	Move file

2.2. Detailed descriptions of commands

2.2.1. AT+QFLDS Get storage data size

AT+QFLDS Get storage data size	ze			
Test Command	Response			
AT+QFLDS=?	ОК			
Write Command	Response			
AT+QFLDS= <namepattern></namepattern>	+QFLDS: <f< td=""><td>ree size>,<tot< td=""><td>al size>[,<maxalloc size="">]</maxalloc></td></tot<></td></f<>	ree size>, <tot< td=""><td>al size>[,<maxalloc size="">]</maxalloc></td></tot<>	al size>[, <maxalloc size="">]</maxalloc>	
	OK			
	Parameter			
	<namepatter< td=""><td>n> pattern</td><td></td></namepatter<>	n> pattern		
		"UFS"	UFS file in flash	
		"RAM"	RAM file (M33 support only)	
		"SD"	SD file (M33 support only)	
	<free size=""></free>	free data size	e in <namepattern></namepattern>	
	<total size=""> total data size in <namepattern></namepattern></total>			
	<maxalloc s<="" th=""><th>size> the 1</th><th>maximum size which can be</th></maxalloc>	size> the 1	maximum size which can be	
		alloca	ted. only valid for RAM file,	
Execution Command	Response			
AT+QFLDS	+QFLDS: <ut< th=""><th>fs file size>,<u< th=""><th>ıfs file number></th></u<></th></ut<>	fs file size>, <u< th=""><th>ıfs file number></th></u<>	ıfs file number>	

	ОК			
	Returns the UFS information			
	Parameter			
	<ufs file="" size=""></ufs>	The size in bytes of all files in UFS		
	<ufs file="" number=""></ufs>	The number of files in UFS		
Reference				

2.2.2. AT+QFLST List files

AT+QFLST List files	
Test Command	Response
AT+QFLST=?	ОК
Write Command	Response
AT+QFLST= <namepattern></namepattern>	+QFLST: <file name="">,<file size="">[,<ram size="">]</ram></file></file>
	ОК
	Parameter
	< namepattern > pattern for filename
	"*" All UFS file in flash
	"RAM:*" All RAM file(M33 support only)
	"SD:*" All SD file (M33 support only)
	"filename" Name of UFS file
	"RAM:filename" Name of RAM file
	"SD:filename" Name of SD file
	<file name=""> Name of the file</file>
	<file size=""></file> Size in bytes of the file
	<ram size=""> Memory size allocated for the file in RAM,</ram>
	only valid for RAM file
Execution Command	Response
AT+QFLST	+QFLST: <file name="">,<file size=""></file></file>
	OK
	List files in the UFS directory
	Parameter
	<file name=""> Name of the file</file>
	<file size=""> Size in bytes of the file</file>
Reference	Note
	Only list files in the "Picture" directory of SD card, do not
	list any directory and any file in the other directories.

2.2.3. AT+QFUPL Upload file to storage

Fest Command Response AT+QFUPL=? +QFUPL: "file name",(1-102400),(1-65535) OK Parameter See Write Command. Parameter Vrite Command Response AT+QFUPL= <file< td=""> CONNECT name>[,<file< td=""> TA switches to data mode, and the bin data of file can be inputted. When the total size of the input data reaches <fil size=""> (unit: byte) or TA receives "+++" sequence from UART, TA returns to command mode and replies the following codes. +OFUPL: <upload size="">,<checksum></checksum></upload></fil></file<></file<>
AT+QFUPL=? +QFUPL: "file name",(1-102400),(1-65535) OK Parameter Parameter See Write Command. Vrite Command Response AT+QFUPL= <file< td=""> CONNECT name>[,<file< td=""> TA switches to data mode, and the bin data of file can be inputted. When the total size of the input data reaches <fil size=""> (unit: byte) or TA receives "+++" sequence from UART, TA returns to command mode and replies the following codes. +OFUPL: <upload size="">,<checksum></checksum></upload></fil></file<></file<>
OK Parameter See Write Command. Vrite Command Response AT+QFUPL= <file< td=""> tame>[,<file< td=""> inputted. When the total size of the input data reaches <fil< td=""> size>][,<timeout>] inputted. When the total size of the input data reaches <fil< td=""> size> (unit: byte) or TA receives "+++" sequence from UART, TA returns to command mode and replies the following codes. +OFUPL: <upload size="">,<checksum></checksum></upload></fil<></timeout></fil<></file<></file<>
OK Parameter See Write Command. Write Command Response AT+QFUPL= <file< td=""> name>[,<file< td=""> ize>][,<timeout>] inputted. When the total size of the input data reaches <fill< td=""> size> (unit: byte) or TA receives "+++" sequence from UART, TA returns to command mode and replies the following codes. +OFUPL: <upload size="">,<checksum></checksum></upload></fill<></timeout></file<></file<>
Parameter See Write Command. Vrite Command Response AT+QFUPL= <file< td=""> iame>[,<file< td=""> inputted. When the total size of the input data reaches <fil< td=""> size> (unit: byte) or TA receives "+++" sequence from UART, TA returns to command mode and replies the following codes. +OFUPL: <up>upload size>,<checksum></checksum></up></fil<></file<></file<>
See Write Command. Write Command Response AT+QFUPL= <file< td=""> CONNECT name>[,<file< td=""> TA switches to data mode, and the bin data of file can be inputted. When the total size of the input data reaches <fil size=""> (unit: byte) or TA receives "+++" sequence from UART, TA returns to command mode and replies the following codes. +OFUPL:<uplead size="">,<checksum></checksum></uplead></fil></file<></file<>
Write Command Response AT+QFUPL= <file< td=""> CONNECT name>[,<file< td=""> TA switches to data mode, and the bin data of file can be inputted. When the total size of the input data reaches <fil size=""> (unit: byte) or TA receives "+++" sequence from UART, TA returns to command mode and replies the following codes. +OFUPL:<uplead size="">,<checksum></checksum></uplead></fil></file<></file<>
AT+QFUPL= <file< td=""> CONNECT name>[,<file< td=""> TA switches to data mode, and the bin data of file can be inputted. When the total size of the input data reaches <fill size=""> (unit: byte) or TA receives "+++" sequence from UART, TA returns to command mode and replies the following codes. +OFUPL:<uplead size="">,<checksum></checksum></uplead></fill></file<></file<>
name>[, <file< td=""> TA switches to data mode, and the bin data of file can be input data reaches <file< td=""> ize>][,<timeout>] inputted. When the total size of the input data reaches <file< td=""> size> (unit: byte) or TA receives "+++" sequence from UART, TA returns to command mode and replies the following codes. +OFUPL: <upload size="">,<checksum></checksum></upload></file<></timeout></file<></file<>
<pre>ize>][,<timeout>] inputted. When the total size of the input data reaches <fil size=""> (unit: byte) or TA receives "+++" sequence from UART, TA returns to command mode and replies th following codes. +OFUPL: <upload size="">,<checksum></checksum></upload></fil></timeout></pre>
<pre>size> (unit: byte) or TA receives "+++" sequence from UART, TA returns to command mode and replies th following codes. +OFUPL: <upload size="">,<checksum></checksum></upload></pre>
UART, TA returns to command mode and replies th following codes. +OFUPL: <upload size="">.<checksum></checksum></upload>
following codes. + OFUPL: <upload size="">.<checksum></checksum></upload>
+OFUPL: <upload size="">,<checksum></checksum></upload>
OK
Parameter
<file name=""> The name of the file to be stored.</file>
\langle file size > 1 he maximum size of the file to upload.
Default is 10240. Unit: byte
<uple>upload size> The size of the actually uploaded data. Unit</uple>
byte
<ti>timeout> The maximum time in seconds to upload dat</ti>
Default is 05555
<cnecksum data<="" of="" th="" the="" uploaded=""></cnecksum>
Note:
format for cfile name >
"filename" File is unloaded to the UES directory
"RAM:filename" File is uploaded to RAM (M3
support only)
"SD:filename" File is unloaded to Picture directory i
SD and (M33 support only)
checksum> is 16 hit checksum based on bitwise XOF
• "+++" sequence will cause TA to end the command an
switch to command mode: however, data previousl
entered are still being preserved as the data of the file
• To execute the command, must appear "CONNECT
before entering the binary data.

2.2.4. AT+QFDWL Download file from storage

AT+QFDWL Download file fr	rom storage	
Test Command	Response	
AT+QFDWL=?	+QFDWL: "file name"	
	ОК	
	Parameter	
	See Write Command.	
Write Command	Response	
AT+QFDWL= <file name=""></file>	CONNECT	
	TA switches to data mode, and the bin data of the file will be	
	outputted. When the file was read over, TA returns to	
	command mode and replies the following codes:	
	+QFDWL: <download size="">,<checksum></checksum></download>	
	ОК	
	Parameter	
	<file name=""> The name of the file to be downloaded</file>	
	<download size=""> The size of the downloaded data</download>	
	<checksum> The checksum of the downloaded data</checksum>	
Reference	Note:	
	• <file name=""></file>	
	"filename" File is uploaded to the UFS directory	
	"RAM:filename" File is uploaded to RAM (M33	
	support only)	
	"SD:filename" File is uploaded to Picture directory in	
	SD card (M33 support only)	
	• "+++" sequence will cause TA to end the command	
	and switch to command mode.	
	• <checksum></checksum> is 16 bit checksum based on bitwise XOR.	

2.2.5. AT+QFDEL Delete file in storage

AT+QFDEL Delete file in storage	
Test Command	Response
AT+QFDEL=?	+QFDEL: "file name"
	ОК
	Parameter
	See Write Command.
Write Command	Response
AT+QFDEL= <file name=""></file>	ОК

	Parameter	
	<file name=""> The</file>	name of the file to be deleted
	۰ ۰ **››	Delete all files in UFS directory (not
		delete the directory)
	"RAM:*"	Delete all files in RAM (M33 support
		only)
	"SD:*"	Delete all files in Picture directory of SD
		card (M33 support only)
	"filename"	delete the specific file "filename" in UFS
		directory
	"RAM:filen	ame" delete the specific file "filename" in
		RAM (M33 support only)
	"SD:filenam	e" delete the specific file "filename" in
		Picture directory of SD card (M33
		support only)
Reference	Note	
	Only delete file in	the Picture directory of SD card, do not
	delete any director	y and any file in the other directories.

2.2.6. AT+QFMOV Move file

AT+QFMOV Move file (M33 support only)				
Test Command	Response			
AT+QFMOV=?	+QFMOV: "src filename", "dest filename", (0,1), (0,1)			
	ОК			
	Parameter			
	See Write Command.			
Write Command	Response			
AT+QFMOV= <src< th=""><th>ОК</th></src<>	ОК			
filename>, <dest< th=""><th>Parameter</th></dest<>	Parameter			
filename>, <copy>,<overwrite< th=""><th><src filename=""> source file</src></th></overwrite<></copy>	<src filename=""> source file</src>			
>	<dest filename=""> destination file</dest>			
	<copy></copy> whether deleting source file after the file is			
	copied			
	0 delete source file after file is copied			
	1 not delete source file after file is copied			
	<overwrite> whether overwrite existed destination file</overwrite>			
	0 Do not overwrite the destination file if it			
	exists			
	1 Overwrite the destination file if it exists			
Reference	Note:			
	• This command is supported only in M33.			

• Can not move file from UFS or SD card to RAM.
• AT+QFMOV="RAM:*","SD:*",1,1 Move all files in
RAM to SD card
• AT+QFMOV="RAM:filenamea","SD:filenameb",1,
1 Move the file named "filenamea" in RAM to SD
card, and rename it as "filenameb".

3. Summary of error codes

Final result code +CME ERROR: <err> indicates an error related to mobile equipment or network. The operation is similar to ERROR result code. Neither ERROR nor OK result code shall be returned. The listed <err> codes here are just related with File. About other <err> codes, please refer to document [1].

Code of <err></err>	Meaning
3915	Non-existent address
3916	UFS storage full
3917	Drive full
3918	Drive error
3919	File not found
3920	Invalid file name
3921	File already existed
3922	Failed to create file
3923	Failed to write file
3924	Failed to open file
3925	Failed to read file

4. Reliable transmission

For reliable transmission when using "**AT**+**QFUPL**" and "**AT**+**QFDWL**" to upload and download file, it's recommended that users turn on hardware flow control capabilities, while also opening MCU hardware flow control function. Using the **AT**+**IFC**=**2**,**2**<**CRLF**> command to open the hardware flow control function for the module. It is turned on by default.

As general serial transmission is reliable, in order to further reliability, we provide additional ways to verify the data transmission reliability by the command's response information.

When using "**AT+QFUPL=<file name> [,<file size>]**" command to upload a file, the module will report "**+QFUPL: <upload size>, <checksum>**" information tips at the end of data transmission. Then MCU can judge whether the data has lost by comparing value of **<upload size>** and **<checksum>**.

<upload size> is the data length which the module received. MCU compares <upload size> and the actual length of the file. If unequal, it means the module lost data.

<checksum> is calculated by doing XOR for every 2 bytes. Similarly MCU calculates the actual file's checksum as below example, and then compares this value with <checksum> which module reports. If not equal, the received data may be problematic. User can re-upload data.

Example for calculating checksum: If the uploaded file data length is 9, the 16 hex values are as follows: 0x23 0x13 0x65 0x B6 0x76 0x88 0xA3 0xEF 0x55

So, checksum is calculated as follows: checksum = 0x2313 XOR 0x65B6 XOR 0x7688 XOR 0xA3EF XOR 0x5500

Every two data form a group and do XOR with another group. If the last group is less than 2 bytes, supplement with 0x00.

Similarly, the module will report the "+QFDWL: <download size>,<checksum>" information when command "AT+QFDWL=<file name>" is completed. <download size> is the actual size of downloaded data, MCU can calculate received data length, and compare it with <download size>. If not equal, the data is lost. MCU also can do checksum calculation and comparison with <checksum>, if not equal, need to re-download.

5. Examples

5.1. File uploading and downloading

AT+QFUPL="test.txt",3222 CONNECT <input file bin data> +QFUPL: 3222,B3E4 // Upload the text file "**test.txt**" to UFS

OK

AT+QFDWL="test.txt"

// Download the file "test.txt" from UFS

CONNECT <output file bin data> +QFDWL: 3222,B3E4

OK

AT+QFUPL="RAM:test2.txt",4222 CONNECT <input file bin data> +QFUPL: 4222,13E4 // Upload the text file "test2.txt" to RAM

OK

AT+QFDWL="SD:pic1.jpg",13222 CONNECT <input file bin data> +QFUPL: 13222,D5E4 //Download the picture file "**pic1.jpg**" from SD card

OK

5.2. File moving

User can move file(s) among RAM, UFS and SD card by command "AT+QFMOV". Please remember user can not move file from UFS or SD card to RAM. Here list examples of moving single file and all files.

5.2.1. Move single file

AT+QFLST="RAM:*" +QFLST: "RAM:Pic.jpg",633	//RAM has file "Pic.jpg" 88,75000
OK <mark>AT+QFLST=''*''</mark> +QFLST: ''pic.jpg'',62076	//UFS also has one file "pic.jpg", but the file size is different
ОК	
AT+QFMOV=''RAM:pic.jpg'	',''pic.jpg'',1,0
+CME ERROR: 3921	//move file "pic.jpg" from RAM to UFS, "1" meansNOT deleting source file after file is copied,"0" means "Do not overwrite the destination
	file if it exists". Because the destination file has existed, so it responses ERROR 3921 (File already existed). The file is not moved. If user confirms the file can be
AT+QFMOV=''RAM:pic.jpg'	overwritten, set the last parameter as "1" as below. ',''pic.jpg'',1,1 //Moving file successfully. The source file "pic.jpg" in RAM is not deleted. The destination file "pic.jpg" in UFS has been
OK AT+QFLST="RAM:*"	overwhiten,
+QFLS1: KAMIPIC.Jpg ,055	88,75000
OK <mark>AT+QFLST=''*''</mark> +QFLST: ''pic.jpg'',63388	
OK	
5.2.2. Move all files of one stor	age
AT+QFLST="RAM:*" +QFLST: "RAM:pic0.jpg",59	024,75000
+QFLST: "RAM:pic1.jpg",62	592,75000
+QFLST: ''RAM:pic2.jpg'',57	168,75000

+QFLST: ''RAM:pic3.jpg'',63216,75000

+QFLST: "RAM:pic4.jpg",64600,75000

+QFLST: ''RAM:pic5.jpg'',60284,75000 OK AT+QFLST="SD:*" OK AT+QFMOV="RAM:*","SD:*",0,0 OK //Move all files in RAM to SD, the first "0" means deleting source files after files are copied, the second "0" means "Do not overwrite the destination file if it exists". SD has not these files, so the last parameter is meaningless in this case. AT+QFLST="RAM:*" //Source files are deleted OK AT+QFLST="SD:*" //All files in RAM have been moved to SD card +QFLST: "SD:pic0.jpg",59024 +QFLST: "SD:pic1.jpg",62592 +QFLST: "SD:pic2.jpg",57168 +QFLST: "SD:pic3.jpg",63216 +QFLST: "SD:pic4.jpg",64600 +QFLST: "SD:pic5.jpg",60284 OK
